WATERTOWN ARSENAL LABORATORY

REPORT DOCUMENT NO. WAL 710/619

Second Partial Report on Problem B-8.7

A  
3 June 1944

Resistance of 7-Ply Silk Webbing to  
Perforation by Fragment-Simulating Projectiles

1. In accordance with a request from the Office, Chief of Ordnance, ballistic tests have been conducted at this arsenal and samples of 7-ply silk webbing supplied by the Russell Manufacturing Company.

2. This material afforded the greatest resistance to perforation by steel-jacketed caliber .45 ball projectiles and by caliber .22 fragment simulating projectiles<sup>2</sup> of any of the fabrics tested in webbing form. Its resistance to perforation by both types of projectiles is about equivalent to that of an equal weight of 17½ ounce nylon duck which has shown the greatest resistance to perforation of any fabric tested here.

3. Samples were drawn taut and tacked to wooden ballistic frames which allow an area 8" by the width of the webbing to remain unsupported from the rear. Impacts of caliber .45 ball (steel-jacketed) projectiles and of caliber .22 fragment-simulating projectiles, G-2, fairly spaced, were then directed into this area. The results of these tests appear in Table I.

4. Under impact of caliber .45 (steel-jacketed) ball projectiles the resistance of this material to perforation (724 feet-per-second) is superior, on a weight for weight basis, to that of nylon webbing (537 feet-per-second)<sup>3</sup> and that of glass webbing (786 feet-per-second, but nearly

twice as heavy)<sup>4</sup> and is equivalent to that of an equal weight of 17½ ounce nylon duck (750 feet-per-second)<sup>5</sup>. It is still considerably inferior, however, to that of an equivalent weight of Hadfield manganese steel (920 feet-per-second).

5. Under impact of a caliber .22 fragment-simulator, G-2, the resistance of this material to perforation (1336 feet-per-second) is superior to that of nylon webbing (1053 feet-per-second) and that of lace webbing (1300 feet-per-second) and again is equivalent to that of an equal weight of 17½ ounce nylon duck (1360 feet-per-second). It is likewise inferior to that of an equivalent weight of Hadfield manganese steel (1630 feet-per-second).

6. Therefore, although it is apparent that no fabric will be equivalent, in resin value to fragment perforation, to Hadfield manganese steel, nevertheless it does bear that, if considerations dictate the use of a fabric as a principal body armor component, this material, as well as 17½ ounce nylon duck deserves serious recommendation.
